PROFESSIONAL SUMMARY

Software engineer who takes systems across boundaries — mobile, backend, ERP, infrastructure — and turns the hard parts into repeatable process. Deep in Android (Jetpack Compose, MVVM, KMM), with production ownership of features spanning iOS, Node.js backends, and CI/CD. Currently focused on AI-native engineering: designing gated, agent-executable workflows that encode how a team ships software, from raw client requirement through released ticket.

WORK EXPERIENCE

Xgrid.co — Senior Software Engineer | Sep 2022 – Present • Islamabad, Pakistan (Hybrid)

AI-Native Engineering & Developer Tooling

- **Authored the NAV → SQL migration workflow** used across both frontend and backend teams to move ERP-backed endpoints off Microsoft Dynamics NAV onto a direct Sequelize/MSSQL backend. Encoded a strangler-fig pattern — locked NAV baselines, dual-service resolvers behind feature flags, automated value-and-type regression comparison — turning a high-risk ERP migration into a deterministic, rollback-safe, agent-executable procedure that engineers outside the backend team could run unaided. **Cut per-endpoint migration time from ~3 hours to ~30 minutes (83%) across ~200 endpoints, saving an estimated 500 engineer-hours.**
- **Designed an agent-executable SDLC pipeline** as part of an org-wide AI-native initiative: seven gated stages (intake → analysis → design → implementation → review → validation → release) driven by a thin orchestrator that advances only on an evidence-backed pass condition and loops back intelligently on failure. Established a stage/capability/engagement skill taxonomy separating sequencing from craft, preventing duplicated logic across the shared skill library. Piloted successfully with peer engineers.
- **Extended the pipeline upstream into discovery** — a gated workflow converting raw client requirements into vertically-sliced, developer-ready tickets whose acceptance criteria trace back to source requirements, handing off into the per-ticket pipeline at an explicitly defined integration seam.

Mobile Engineering — Android, iOS, KMM

- Enhanced and maintained a production Android app using MVVM, Dependency Injection, and the Repository pattern (local & remote) for seamless offline/online functionality.
- Integrated Bluetooth Beacons via the Gimbal SDK and iBeacon technology for proximity-based user detection, **adopted by the client across 85%+ of their jobsites.**
- Built a digital signature feature and an image capture/upload module with targeted optimizations: **compression reduced signature file size by 90%**, and refined image handling eliminated memory issues under load.
- Integrated cloud services into core functionality: AWS S3 for secure video streaming, and Firebase Cloud Messaging for reliable push/in-app notifications with server-side history.
- Drove development efficiency with unit tests (JUnit) and an automated Android build pipeline, improving reliability and **cutting deployment time by 75%.**
- **Leading the migration of native Android & iOS apps to Kotlin Multiplatform Mobile**, maximizing shared code while retaining native components; structured the KMM project with modular architecture following SOLID principles and platform-specific best practices.
- Contributed to the iPhone app (SwiftUI, MVVM, Delegate pattern) on support tasks and feature work — trusted to backstop the iOS team during high-volume periods to protect deadlines.
- Built a task management system in the iPad app (UIKit, MVC) featuring dynamic calendar views (month, 2-week, week, day), drag-and-drop, and automated estimates derived from task work parameters.

Platform, Backend & Integration

- Solely designed and implemented the end-to-end iBeacon feature across Android, iOS, and backend systems (API/ERP), achieving **99% detection accuracy**. Automated beacon configuration with a Python tool that processed CSV inputs and managed settings via the Gimbal Manager Portal API.
- Took initiative to stabilize the backend CI/CD pipeline for API packages (GitHub Actions/Docker), diagnosing and fixing issues that **halved deployment errors**. Resolved self-hosted runner failures, rectified Docker image synchronization across development environments, and hardened deployment scripts for the API team.

Leadership

- Technical lead on the KMM migration, defining project structure and architectural standards for the mobile team.
- Conducted 20+ technical interviews across all levels (Intern to Senior Android Engineer), evaluating technical skill and cultural fit.

TECHNICAL SKILLS

Languages: Kotlin, Java, Swift, JavaScript, Python, SQL, AL

Android & KMM: Jetpack Compose, XML, Coroutines, LiveData, Hilt, Retrofit, Ktor, WorkManager, Navigation Component, CameraX, Coil, Gradle

iOS: SwiftUI, UIKit, Alamofire, Fastlane

Backend & Data: Node.js, Sequelize ORM, MSSQL, REST APIs, Microsoft Dynamics 365 / NAV

Platform & Tooling: Docker, GitHub Actions, Git, Firebase (FCM, Crashlytics), AWS S3

Architecture & Practice: MVVM, MVC, MVI, Clean Architecture, SOLID, Agile, AI-native / agentic engineering workflows

EDUCATION

National University of Computer and Emerging Sciences (FAST-NUCES) / *Sep 2018 – Jul 2022*

B.S. Computer Science — Islamabad, Pakistan

Final Year Project: Accident Detection and Emergency Response System
